

## How To Build Your Own Colloidal Silver Generator

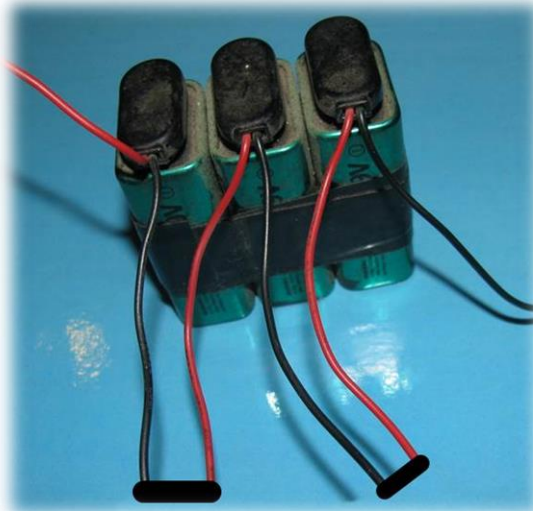

Take (3) 9 volt batteries and use electrical tape to tape them together like this

Then take (3) 9 volt battery Snap Connectors like this

Then wire them together in a "series" circuit – Red connected to Black like this

This leaves you with a red “+” wire and a black “-” wire on which you attach alligator clips

This gives you a 27 volt colloidal silver generator  
Just clip the alligator clips to some pure silver wires (electrodes) and stick them in a quart jar of water for one hour – and you have just made your own colloidal silver.

Silver Wire bent to fit over rim of jar to keep alligator clips from falling into the water.
